

A REAL RUN, ON FILM

One chat message.
3 tasks. 2 workers failed
and were replaced.
Whole test suite green.

\$0 paid

The machine behind it, in 9 slides →

THE PROBLEM

Your best AI model is *expensive* and brilliant.

And you use it for everything. The architecture decision. And the fortieth boilerplate test. Same price per token.

THE IDEA

One frontier brain. *An elastic workforce.*

Your best model keeps the strategy. Leverage sits underneath it and hires cheaper models for the work that only needs to be verified, not invented.

WHERE THE WORKERS COME FROM

Three sources. *No new bill.*

Local

Models on your own machine, through Ollama

Free

Free hosted routes, swept daily for the ones that answer

Yours

The subscription you already pay for, as a worker seat

Budget \$0 removes paid routes before the auction. Not outranked. Removed.

HOW A MISSION RUNS

Six stages. *One rule.*

01

Compile

goal to a task graph a test can prove

02

Auction

every reachable model, scored

03

Hire

the best eligible one

04

Execute

as a RocketRide pipeline

05

Verify

the repo's own tests are the gate

06

Prove

checks, files, hash, real spend

WHEN A WORKER FAILS

It is *replaced*, not retried.

A rate limit, a timeout or a red test releases the worker. What it understood is checkpointed. A replacement resumes from the checkpoint. The work continues instead of restarting.

```
429 → checkpoint → replacement → resumed
```

THE RULE

Verified or nothing.

A task is done when the tests exit 0. After the last task, the whole suite runs once more. Every completion carries a proof pack: the checks that ran, the files changed, the real spend.

IT HAPPENED, ON FILM

A security repo. *One message.*

45.7s

TO PLAN 3 TASKS

2

REAL HANDOFFS

100

QUALITY SCORE

\$0.00

PAID INFERENCE

Three guards from the OWASP Top 10, planned by a free model, passed on attempt two, whole suite green, proof returned into the chat.

USE IT

Three ways in. *No API key.*

Claude Code

add it as an MCP server, then ask it to finish the app

Any chat

a connector URL. One message starts a mission

Terminal

point it at a repo and a goal

88 tests. CI green. Open source, MIT.

TRY IT IN 30 SECONDS

Press the button.
*A real mission runs
while you watch.*
